Process & Decision Documentation

I initially planned to take the example code that we were giving and expand on that based on the prompt we were given, which was to create a new level using the JSON data and use loops to place words.

I changed the example code from the original 1 level game to have another level using the JSON data, and used a for loop to add in words at the top left of the screen. The user is now able to see the words and have another level after the initial one.

GenAI wasn't used during this side quest.
